BEST™ for your **HOME**

Benefits of Energy Saving Technology

Complete Energy Efficient Systems

ROOFING | SIDING | WINDOWS | DOORS | INSULATION

For homeowners, the benefits of energy saving technology are numerous. An air-sealed house is a fortified shell against the elements, keeping occupants comfortable and productive regardless of outdoor temperatures, and transforming every room into usable space. It also provides protection from mold and pollutants impacting respiratory illness and allergies.

Many Energy Star rated products feature noise reduction. Similar to luxury cars, quality windows and insulated siding dramatically buffer sound and vibration, resulting in a noticeably quieter interior. Any realtor will confirm that buyers want a low maintenance, energy efficient house because it has increased value and is less costly to own. The real estate market shows that houses built in the 1980s list longer and sell lower due to inefficient systems such as the era's signature uninsulated cathedral ceiling and recessed lighting.

Smart upgrades start at the top. When replacing the roof, add a reflective barrier to deflect up to 97% of radiant energy. A properly insulated and air-sealed attic will reduce heating and cooling costs by up to 30%. Calculate the cost of improvements and savings to see the return on your investment is far greater than a new kitchen or swimming pool—neither of which entitle you to a tax rebate.
